# First-Order Logic

Chapter 8

### Last chapter

Logical agents apply inference to a knowledge base to derive new information and make decisions

#### Basic concepts of logic:

- syntax (语法): formal structure of sentences
- semantics (语义): truth of sentences wrt models
- entailment (蕴涵): necessary truth of one sentence given another
- inference (推理): deriving sentences from other sentences
- soundness (可靠性): derivations produce only entailed sentences
- completeness (完备性): derivations can produce all entailed sentences

Forward, backward chaining are linear-time, complete for Horn clauses Resolution is complete for propositional logic

Propositional logic lacks expressive power

### Outline

- Why FOL?
- Syntax and semantics of FOL
- Using FOL
- □ Knowledge engineering(知识工程) in FOL

# Pros (优点) of propositional logic

- ② Propositional logic is declarative (陈述性的)
  - □ 知识和推理分开,而且推理完全不依赖于领域
  - □ 对比:程序设计语言——过程性语言
    - 缺乏从其它事实派生出事实的通用机制
    - 对数据结构的更新通过一个领域特定的过程来完成
- © Propositional logic allows partial (不完全) /disjunctive (分离的) /negated information
  - (unlike most data structures and databases)
- ② Propositional logic is compositional (合成性的):
  - meaning of  $B_{1,1} \wedge P_{1,2}$  is derived from meaning of  $B_{1,1}$  and of  $P_{1,2}$  (语句的含义是它的各部分含义的一个函数)
- Meaning in propositional logic is context-independent
  - (unlike natural language, where meaning depends on context)

# Cons (缺点) of propositional logic

- Propositional logic has very limited expressive power
  - (unlike natural language)
  - E.g., cannot say "pits cause breezes in adjacent squares" except by writing one sentence for each square

$$B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$$

# Cons (缺点) of propositional logic

- All students know arithmetic.
  - □ AliceIsStudent → AliceKnowsArithmetic
  - BoblsStudent → BobKnowsArithmetic

• • •

- Propositional logic is very clunky. What's missing?
  - Objects and relations: propositions (e.g., AliceKnowsArithmetic) have more internal structure (alice, Knows, arithmetic)
  - Quantifiers and variables: all is a quantifier which applies to each person, don't want to enumerate them all...

### First-order logic

采用命题逻辑的基础—陈述式、上下文无关和合成语义,并借用自然语言的思想。

Whereas propositional logic assumes the world contains facts, first-order logic (like natural language) assumes the world contains

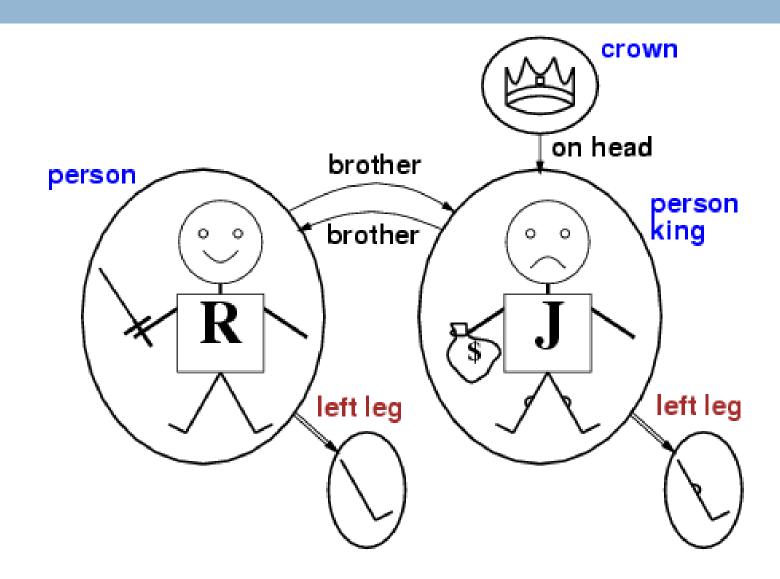

- Objects (対象): people, houses, numbers, colors, baseball games, wars, ...
- Relations (关系): red, round, prime..., brother of, bigger than, part of, comes between, ...
- Functions (函数): father of, best friend, one more than, plus, ...

谓词用来描述个体(可以独立存在的事物)之 间的关系或属性

# Logics in general

语言	本体论约定(世界中存在的)	认识论约定 (智能体对事实所相信的内容)
命题逻辑 Propositional logic	事实	真/假/未知
一阶逻辑 First-order logic	事实、对象、关系	真/假/未知
时序逻辑 Temporal logic	事实、对象、关系、时间	真/假/未知
概率逻辑 Probability theory	事实	信度∈[0,1]

# 一阶逻辑的模型: Example

## Syntax of FOL: Basic elements

- □ Constants/常量
- □ Predicates/谓词
- □ Functions/函数
- □ Variables/变量
- □ Connectives/连接词
- □ Equality/等词
- □ Quantifiers/量词

King John, 2, USTC,...

Brother, >,...

Sqrt, LeftLegOf,...

x, y, a, b,...

$$\neg$$
,  $\Rightarrow$ ,  $\wedge$ ,  $\vee$ ,  $\Leftrightarrow$ 

=

 $\forall$ ,  $\exists$ 

# Atomic sentences (原子语句)

```
Term = function (term_1,...,term_n)
or constant or variable
```

```
Atomic sentence = predicate (term_1,...,term_n)
or term_1 = term_2
```

- E.g., Brother(KingJohn, RichardTheLionheart)
  - > (Length(LeftLegOf(Richard)), Length(LeftLegOf(KingJohn)))

# Complex sentences (复合语句)

Complex sentences are made from atomic sentences using connectives

$$\neg S$$
,  $S_1 \land S_2$ ,  $S_1 \lor S_2$ ,  $S_1 \Rightarrow S_2$ ,  $S_1 \Leftrightarrow S_2$ ,

E.g. Sibling(KingJohn,Richard)  $\Rightarrow$  Sibling(Richard,KingJohn)  $>(1,2) \lor \leq (1,2)$ 

$$>(1,2) \land \neg >(1,2)$$

### Truth in first-order logic

- □ 语句的真值由一个模型和对句子符号的解释来判定。
  Sentences are true with respect to a model and an interpretation
- □ Model contains objects (domain elements域元素) and relations among them
- □ 我们需要一个对分别被常量、谓词和函数符号指代的对象、关系和函数 进行详细说明的解释

Interpretation specifies referents (指代) for constant symbols → objects predicate symbols → relations function symbols → functional relations

An atomic sentence predicate(term<sub>1</sub>,...,term<sub>n</sub>) is true iff the objects referred to by term<sub>1</sub>,...,term<sub>n</sub> are in the relation referred to by predicate

### Truth example

Consider the interpretation in which

Richard → Richard the Lionheart

John → the evil King John

Brother → the brotherhood relation

Under this interpretation, Brother(Richard, John) is true just in case Richard the Lionheart and the evil King John are in the brotherhood relation in the model

#### Models for FOL: Lots!

Entailment (蕴涵) in propositional logic (命题逻辑) can be computed by enumerating (枚举) models

We can enumerate the FOL models for a given KB vocabulary:

For each number of domain elements n from 1 to  $\infty$ 

For each k-ary predicate(k元谓词)  $P_k$  in the vocabulary

For each possible k-ary relation on n objects

For each constant symbol C in the vocabulary

For each choice of referent for C from n objects ...

Computing entailment by enumerating FOL models is not easy! 通过枚举所有可能模型以检验"语义后承"在一阶逻辑中不可行

## Universal quantification (全称量词)

```
∀<variables> <sentence>
 "对于所有的....."
Everyone at USTC is smart:
\forall x \ At(x,USTC) \Rightarrow Smart(x)
\forall x \ P is true in a model m iff P is true with x being each possible
   object in the model
Roughly speaking, equivalent to the conjunction of instantiations (实例
   的合取式) of P
                  At(KingJohn,USTC) \Rightarrow Smart(KingJohn)
                  At(Richard,USTC) \Rightarrow Smart(Richard)
         Λ
```

 $At(USTC,USTC) \Rightarrow Smart(USTC)$ 

**^** ...

#### A common mistake to avoid

Typically,  $\Rightarrow$  is the main connective with  $\forall$ 

在需要用全称量词书写一般规则的时候, ⇒的真值表项是一个理想的选择

Common mistake: using  $\wedge$  as the main connective with  $\forall$ :

 $\forall x \ At(x,USTC) \land Smart(x)$ 

means "Everyone is at USTC and everyone is smart"

# Existential quantification (存在量词)

Someone at USTC is smart:

 $\exists x \; \mathsf{At}(x,\mathsf{USTC}) \land \mathsf{Smart}(x)$ 

 $\exists x \ P$  is true in a model m iff P is true with x being some possible object in the model

Roughly speaking, equivalent to the disjunction of instantiations (实例的析取式) of P

At(KingJohn,USTC) ∧ Smart(KingJohn)

- ∨ At(Richard,USTC) ∧ Smart(Richard)
- ∨ At(USTC,USTC) ∧ Smart(USTC)
- V ...

#### Another common mistake to avoid

Typically,  $\wedge$  is the main connective with  $\exists$ 

Common mistake: using  $\Rightarrow$  as the main connective with  $\exists$ :  $\exists x \; At(x,USTC) \Rightarrow Smart(x)$ 

is true if there is anyone who is not at USTC!

### Properties of quantifiers

```
\forall x \ \forall y \ \text{is the same as} \ \forall y \ \forall x
\exists x \exists y \text{ is the same as } \exists y \exists x
\exists x \ \forall y \ \text{is not the same as} \ \forall y \ \exists x
    \exists x \ \forall y \ Loves(x,y)
     "There is a person who loves everyone in the world"
     \forall y \exists x Loves(x,y)
     "Everyone in the world is loved by at least one person"
Quantifier duality (量词的二义性): each can be expressed using the other
     \forall x \text{ Likes}(x, \text{IceCream}) \qquad \neg \exists x \neg \text{Likes}(x, \text{IceCream})
                                                      \neg \forall x \neg Likes(x, Broccoli)
    ∃x Likes(x,Broccoli)
```

# Equality (等式)

 $term_1 = term_2$  is true under a given interpretation if and only if  $term_1$  and  $term_2$  refer to the same object (指 代的对象是相同的)

E.g., definition of Sibling in terms of Parent:

$$\forall x,y \; Sibling(x,y) \Leftrightarrow [\neg(x = y) \land \exists m,f \neg (m = f) \land Parent(m,x) \land Parent(f,x) \land Parent(m,y) \land Parent(f,y)]$$

#### Outline

- Why FOL?
- Syntax and semantics of FOL
- □ Using FOL
- □ Knowledge engineering(知识工程) in FOL

## Using FOL

#### The kinship(亲属关系) domain:

Brothers are siblings

$$\forall$$
 x, y Brother(x,y)  $\Rightarrow$  Sibling(x, y).

"Sibling" is symmetric

$$\forall$$
 x, y Sibling(x, y)  $\Leftrightarrow$  Sibling(y, x).

One's mother is one's female parent

$$\forall$$
 x, y Mother(x, y)  $\Leftrightarrow$  (Female(x)  $\land$  Parent(x, y)).

A cousin is a child of a parent's sibling

$$\forall$$
 x, y Cousin(x,y)  $\Leftrightarrow \exists$  p, ps Parent(p, x)  $\land$  Sibling(ps, p)  $\land$ Parent(ps, y)

### Using FOL

#### <u>The set (集合) domain:</u>

集合就是空集或通过将一些元素添加到一个集合而构成 $\forall s \ Set(s) \Leftrightarrow (s = \{\}) \lor (\exists x,s_2 \ Set(s_2) \land s = \{x \mid s_2\})$ 

空集没有任何元素,也就是说,空集无法再分解为更小的集合和元素 $\neg\exists x,s \{x \mid s\} = \{\}$ 

将已经存在于集合中的元素添加到该集合,无任何变化 $\forall x,s \ x \in s \Leftrightarrow s = \{x \mid s\}$ 

集合的元素仅是那些被添加到集合中的元素  $\forall x,s \ x \in s \Leftrightarrow [\exists y,s_2] (s = \{y \mid s_2\} \land (x = y \lor x \in s_2))]$ 

### Using FOL

#### The set (集合) domain:

一个集合是另一个集合的子集,当且仅当第一个集合的所有元素都是第二个 集合的元素

$$\forall s_1, s_2 \quad s_1 \subseteq s_2 \Leftrightarrow (\forall x \quad x \in s_1 \Rightarrow x \in s_2)$$

两个集合是相同的, 当且仅当它们互为子集

$$\forall s_1, s_2 \quad (s_1 = s_2) \Leftrightarrow (s_1 \subseteq s_2 \land s_2 \subseteq s_1)$$

一个对象是两个集合的交集的元素,当且仅当它同时是这两个集合的元素  $\forall x,s_1,s_2 \ x \in (s_1 \cap s_2) \Leftrightarrow (x \in s_1 \land x \in s_2)$ 

一个对象是两个集合的并集的元素,当且仅当它是其中某一集合的元素  $\forall x,s_1,s_2 \quad x \in (s_1 \cup s_2) \Leftrightarrow (x \in s_1 \vee x \in s_2)$ 

### Interacting with FOL KBs

Suppose a wumpus-world agent is using an FOL KB and perceives a smell and a breeze (but no glitter) at t=5:

```
Tell(KB,Percept([Smell,Breeze,None],5))
Ask(KB,\exists a BestAction(a,5))
I.e., does the KB entail some best action at t=5?
Answer: Yes, {a/Shoot} ← substitution (binding list 绑定表)
Given a sentence S and a substitution \sigma,
So denotes the result of plugging \sigma into S; e.g.,
S = Smarter(x,y)
\sigma = \{x/Hillary,y/Bill\}
S\sigma = Smarter(Hillary,Bill)
Ask(KB,S) returns some/all \sigma such that KB \models \sigma
```

### Knowledge base for the wumpus world

#### Perception (感知)

□  $\forall$ t,s,b Percept([s,b,Glitter],t)  $\Rightarrow$  Glitter(t)

#### Reflex

 $\Box$   $\forall$ t Glitter(t)  $\Rightarrow$  BestAction(Grab,t)

Reflex with internal state: do we have the gold already?

 $\forall$  t AtGold(t)  $\land \neg$  Holding(Gold, t)  $\Rightarrow$  BestAction(Grab, t)

Holding(Gold, t) cannot be observed ⇒ keeping track of change is essential

### Deducing hidden properties

#### Definition of adjacent squares

```
\forall x,y,a,b \quad Adjacent([x,y],[a,b]) \Leftrightarrow [a,b] \in \{[x+1,y], [x-1,y],[x,y+1],[x,y-1]\}
```

#### Properties of squares:

```
\foralls,t At(Agent,s,t) \land Breeze(t) \Rightarrow Breezy(s)
```

#### Squares are breezy near a pit:

```
Diagnostic rule(诊断规则)— infer cause from effect
∀s Breezy(s) ⇒ ∃r Adjacent(r,s) ∧ Pit(r)

Causal rule(因果规则)— infer effect from cause
∀r,s Adjacent(r,s)∧Pit(r) ⇒ Breezy(s)
```

Neither of these is complete — e.g., the causal rule doesn't say whether squares far away from pits can be breezy

Definition (定义) for the Breezy predicate:

```
\foralls Breezy(s) \Leftrightarrow \existsr Adjacent(r,s) \land Pit(r)
```

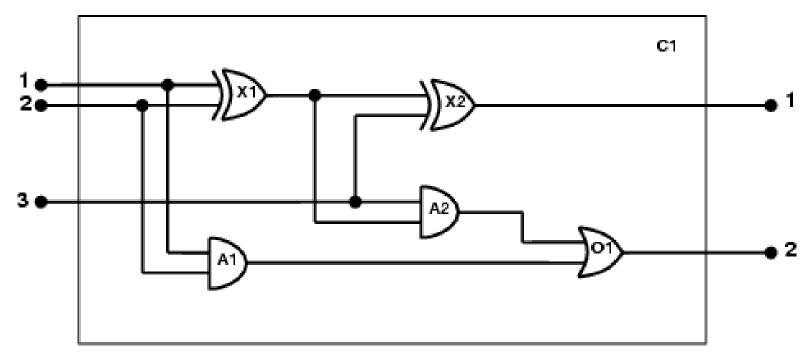

#### Outline

- Why FOL?
- Syntax and semantics of FOL
- Using FOL
- □ Knowledge engineering (知识工程) in FOL

# Knowledge engineering(知识工程) in FOL

- 1. Identify the task 确定任务
- 2. Assemble the relevant knowledge 搜集相关知识
- 3. Decide on a vocabulary of predicates, functions, and constants 确定谓词、函数和常量的词汇表
- 4. Encode general knowledge about the domain 对域的通用知识进行编码
- 5. Encode a description of the specific problem instance 对特定问题实例的描述进行编码
- 6. Pose queries to the inference procedure and get answers 把查询提交给推理过程并获取答案
- 7. Debug the knowledge base 调试知识库

#### One-bit full adder (一位全加器)

最初的两个输入是需要相加的两位,第三个输入是一个进位。第一个输出是和,第二个输出是下一个加法器的进位。

- 1. Identify the task
  - Does the circuit actually add properly? (circuit verification)
- 2. Assemble the relevant knowledge
  - Composed of wires (导线) and gates (门); Types of gates (AND, OR, XOR, NOT)
  - Irrelevant: size, shape, color, cost of gates
- 3. Decide on a vocabulary (词汇表)
  - Alternatives:

```
Type(X_1) = XORType(X_1, XOR)XOR(X_1)
```

```
Encode (编码) general knowledge of the domain
(1) 如果两个接线端是相连的,那么它们具有相同的信号
       \forall t_1, t_2 \mid Connected(t_1, t_2) \Rightarrow Signal(t_1) = Signal(t_2)
(2) 每个接线端的信号不是1就是0(不可能两者都是)
       1 \neq 0
(3) Connected是一个可交换谓词
       \forall t_1, t_2 \quad Connected(t_1, t_2) \Rightarrow Connected(t_2, t_1)
(4) 或门的输出为1, 当且仅当它的某一个输入为1
       \forall q \; \mathsf{Type}(q) = \mathsf{OR} \Rightarrow
       Signal(Out(1,q)) = 1 \Leftrightarrow \exists n \ Signal(In(n,q)) = 1
(5) 与门的输出为0、当且仅当它的某一个输入为0
       \forall a \; \mathsf{Type}(a) = \mathsf{AND}
       \Rightarrow Signal(Out(1,q)) = 0 \Leftrightarrow \exists n Signal(ln(n,q)) = 0
(6) 异或门的输出为1, 当且仅当它的输入是不相同的
       \forall a \; \mathsf{Type}(a) = \mathsf{XOR}
       \Rightarrow Signal(Out(1,g)) = 1 \Leftrightarrow Signal(ln(1,g)) \neq Signal(ln(2,g))
(7) 非门的输出与它的输入相反
       \forall q \; \mathsf{Type}(q) = \mathsf{NOT} \Rightarrow \mathsf{Signal}(\mathsf{Out}(1,q)) \neq \mathsf{Signal}(\mathsf{In}(1,q))
```

#### 5. Encode the specific problem instance

首先对门加以分类  $\mathsf{Type}(\mathsf{X}_1) = \mathsf{XOR} \qquad \mathsf{Type}(\mathsf{X}_2) = \mathsf{XOR}$   $\mathsf{Type}(\mathsf{A}_1) = \mathsf{AND} \qquad \mathsf{Type}(\mathsf{A}_2) = \mathsf{AND}$   $\mathsf{Type}(\mathsf{O}_1) = \mathsf{OR}$ 

其次说明门与门之间的连接

6. Pose queries to the inference procedure—把查询提交给推理过程 What are the possible sets of values of all the terminals for the adder circuit? 对于1位全加器有哪些可能的输入与输出组合?

$$\exists i_1, i_2, i_3, o_1, o_2 \quad Signal(In(1, C_1)) = i_1 \land Signal(In(2, C_1)) = i_2 \land Signal(In(3, C_1)) = i_3 \land Signal(Out(1, C_1)) = o_1 \land Signal(Out(2, C_1)) = o_2$$

7. Debug the knowledge base

May have omitted assertions like  $1 \neq 0$ 

对异或门(XOR)尤其重要:

 $Signal(Out(1,X_1))=1 \Leftrightarrow Signal(In(1,X_1)) \neq Signal(In(2,X_1))$ 

# Summary

命题逻辑只是对事物的存在进行限定,而一阶逻辑对于对象和关系的存在进行限定,因而获得更强的表达能力。

#### First-order logic:

- objects and relations are semantic primitives (基本)
- syntax: constants, functions, predicates, equality, quantifiers
  - 语句的真值由一个模型和对句子符号的解释来判定。

#### Increased expressive power: sufficient to define wumpus world

在一阶逻辑中开发知识库是一个细致的过程,包括对域进行分析、选择词汇表、对支持所需推理必不可少的公理进行编码。

# 作业
